# I. Overview

## 1. Code Packages/Namespaces

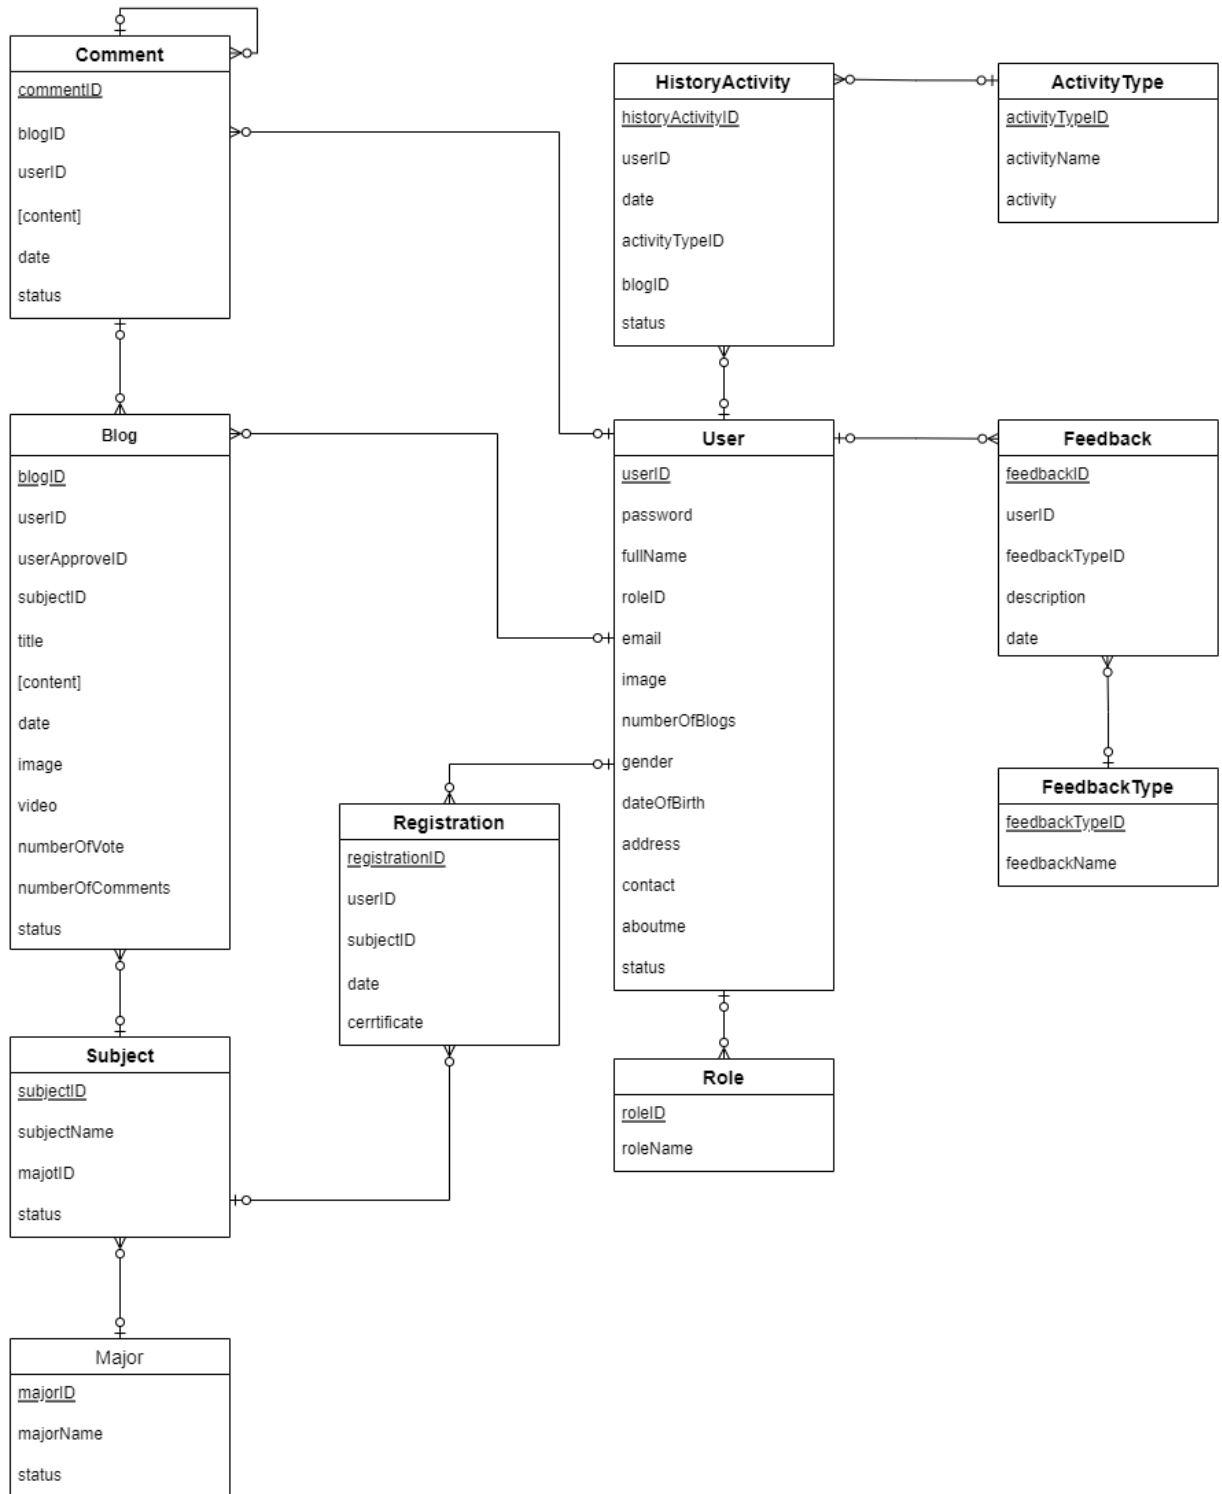

*Package descriptions & package class naming conventions*

| No | Package    | Description                                                                                                                                                                            |
|----|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | View       | This is where the JSP pages do the work of displaying the user interface. The first word is in lowercase (camel case notation).                                                        |
| 02 | Controller | Functional controllers will be passed through the MainController to execute its functions.<br>Capital letters at the beginning of each word , according to the syntax: Verb+Controller |
| 03 | DAO        | Contains functions that execute commands related to handling the database. Nouns, capital letters for each word. Write whole words, avoid abbreviations.                               |
| 04 | DTO        | Contains all DTO classes                                                                                                                                                               |

## 2. Database Schema

**Table descriptions & package class naming conventions are as below**

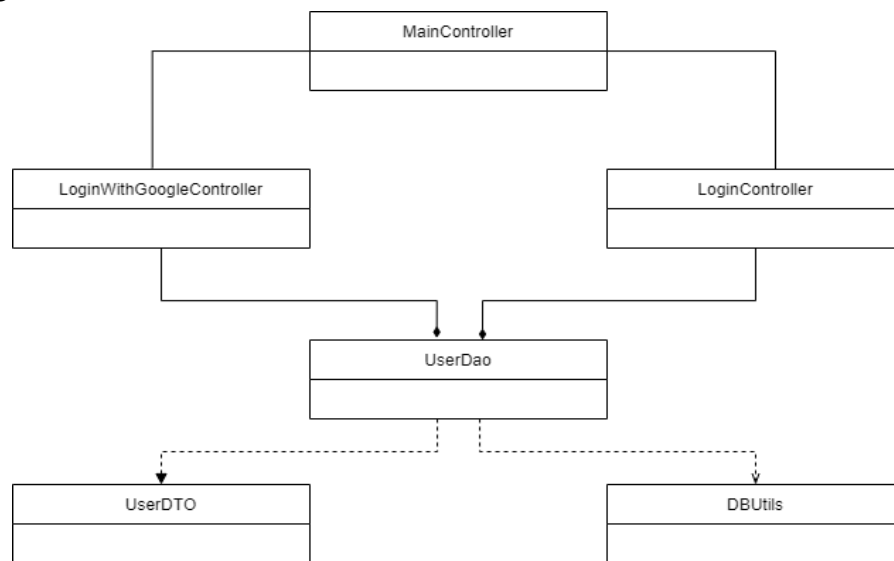

| No | Table                      | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|----|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | <i>dbo.Blog</i>            | <ul style="list-style-type: none"> <li>- The table contains information about a specific blog, that subject name such as blog's id, author's id, comment id, subject's id and mentor approver's id, the title of blog, date viết, image/video, number of vote, number of comment and status of blog</li> <li>- Primary keys: BlogID</li> <li>- Foreign keys: UserID, CommentID, SubjectID</li> </ul> |
| 02 | <i>dbo.User</i>            | <ul style="list-style-type: none"> <li>- The table contains information about a particular user such as user's id, and role id, email, password, full name, image, number of the blogs, gender, date of birth, address, contact, information of user and the status</li> <li>- Primary keys: userID</li> <li>- Foreign keys: roleID</li> </ul>                                                       |
| 03 | <i>dbo.Major</i>           | <ul style="list-style-type: none"> <li>- The table contains information about a major cụ thể such as major's id, tên của major and status.</li> <li>- Primary keys: majorID</li> <li>- Foreign keys: None</li> </ul>                                                                                                                                                                                 |
| 04 | <i>dbo.Subject</i>         | <p>The table contains information about a specific subject such as the subject's id, the name of that subject, the major to which that subject belongs, and the status of that subject.</p> <ul style="list-style-type: none"> <li>- Primary keys: subjectID</li> <li>- Foreign keys: majorID</li> </ul>                                                                                             |
| 05 | <i>dbo.Comment</i>         | <p>The table contains information that the comment should have such as the id, the id of the blog to which the comment belongs, who owns this comment, the content of the comment, the date the user left the comment, and the status of that comment.</p> <ul style="list-style-type: none"> <li>- Primary keys: commentID</li> <li>- Foreign keys: blogID, userID, commentID</li> </ul>            |
| 06 | <i>dbo.Registration</i>    | <ul style="list-style-type: none"> <li>- The table contains information about a Registration such as registration' id, user's id, subject's id, date register and certificate</li> <li>- Primary keys: registrationID</li> <li>- Foreign keys: userID, subjectID</li> </ul>                                                                                                                          |
| 07 | <i>dbo.Feedback</i>        | <ul style="list-style-type: none"> <li>- The table contains information about feedback such as feedback id and author's id, type feedback id, description of feedback and date post feedback.</li> <li>- Primary keys: feedbackID</li> <li>- Foreign keys: userID</li> </ul>                                                                                                                         |
| 08 | <i>dbo.Role</i>            | <ul style="list-style-type: none"> <li>- The table contains information about a role of user such as role's id and role name</li> <li>- Primary keys: roleID</li> <li>- Foreign keys: None</li> </ul>                                                                                                                                                                                                |
| 09 | <i>dbo.FeedbackType</i>    | <ul style="list-style-type: none"> <li>- The table contains information about a type of feedback such as type feedback id and feedback name.</li> <li>- Primary keys: feedbackTypeID</li> <li>- Foreign keys: None</li> </ul>                                                                                                                                                                        |
| 10 | <i>dbo.HistoryActivity</i> | <ul style="list-style-type: none"> <li>- The table contains information about a history activity such as history activity id, activity type id, user's id, date of activity, blog id and status</li> <li>- Primary keys: historyActivityID</li> <li>- Foreign keys: userID, activityTypeID</li> </ul>                                                                                                |

## II. Code Designs

### 1. Welcome

#### a. Class Diagram

#### b. Class Specifications

##### *GoogleUtils Class*

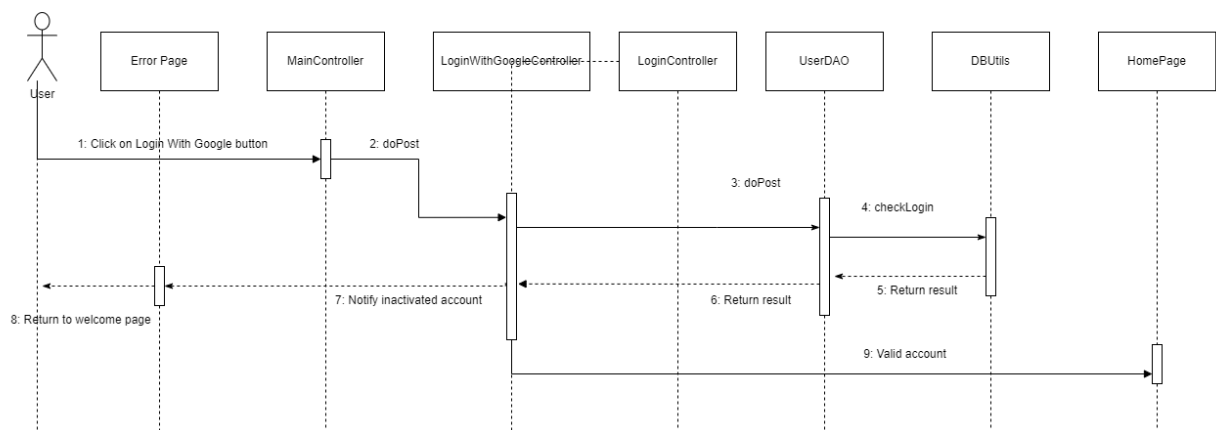

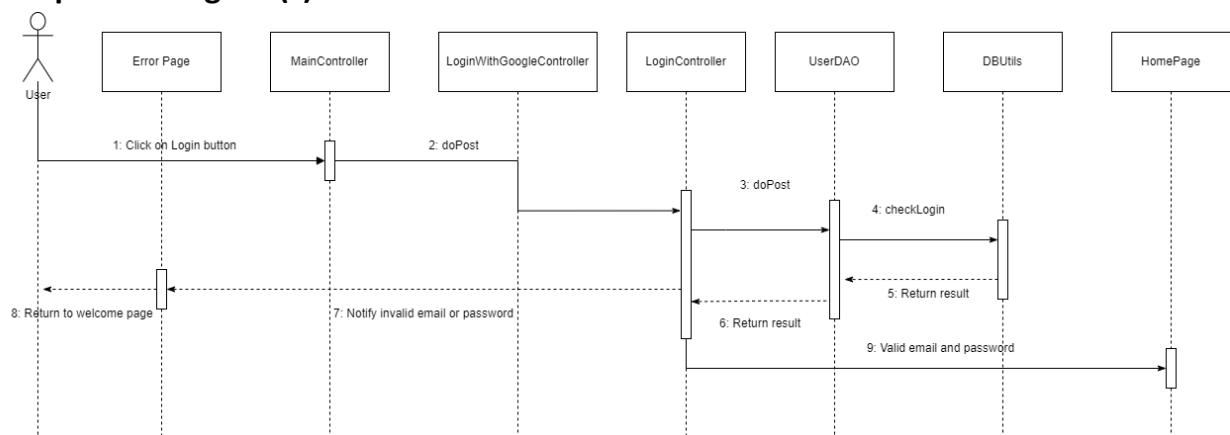

| No | Method                                                                  | Description                                                                                                                                                                                                                                                                                                                    |
|----|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | public static String<br>getToken(final String<br>code)                  | This is a commonly used method to create an access token for signing in with a Google account. In this method, we need to provide a code and process google information such as google client ID, google client secret, etc for the response. If created successfully, return an access token with the String type, else null. |
| 02 | public static<br>GooglePojo<br>getUserInfo(final<br>String accessToken) | This is a commonly used method to get user information from a Google account. In this method, we need to provide an access token for creating a link to request a response. If returning a response, return a Google Pojo object, else null.                                                                                   |

##### *UserDAOClass*

| No | Method                                                            | Description                                                                                                                                                                                                                                                                |
|----|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | public UserDTO<br>checkLogin(String<br>email, String<br>password) | This method is used to check the existence of an account for logging in by email and password. In this method, we need to provide an email and a password to find this account. If finding an account successfully, returns user information with UserDTO type, else null. |

|    |                                                                                 |                                                                                                                                                                                                                                                               |
|----|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 02 | public UserDTO<br>checkLoginByEmail(String email)                               | This method is used to check the existence of an account for logging in by Google accounts. In this method, we need to provide an email to find this account. If finding an account successfully, return user information with UserDTO type, else null.       |
| 03 | public String<br>checkRole(int roleID)                                          | This method is used to check the role of an account for logging in by Google accounts. In this method, we need to provide a role ID to find the name of this role. If finding the role name successfully, return role name, else null.                        |
| 04 | public boolean<br>createUser(String<br>fullName, String<br>email, String image) | This method is used to create a new user for logging in by Google account. In this method, we need to provide a full name, an email, and the image of this account and insert this user into the database. If inserted successfully, return true, else false. |
